

Problem 7: Litter Box and Food Bowl Placing

Time Limit: 2s

Jacob is trying to figure out where to place his litter box in the optimal spot. At the same time, he also needs to put the food bowl somewhere. He read online that you should try and place the litter box and the food bowl as far away as possible. Jacob has managed to model his house as a 2D plane and has N possible locations for the litter box, (L_x, L_y) , and M possible locations for the food bowl (F_x, F_y) . He wants to know where to place the litter box and food bowl such that the distance between the litter box and food bowl is maximized.

Constraints

$$1 \leq N, M \leq 10^3$$
$$-10^4 \leq L_x, L_y, F_x, F_y \leq 10^4$$

It is guaranteed that there will never be a tie for the maximum distance.

Input Specification

The first line will contain 2 space separated integers N and M . The next N lines will contain 2 space separated integers L_x and L_y . The next M lines will contain 2 space separated integers F_x and F_y .

Output Specification

The first line of output should contain 2 space separated integers L_x and L_y representing the location of the litter box. The second line of output should contain 2 space separated integers F_x and F_y representing the location of the food bowl.

Sample Input

```
3 2
0 5
-9 4
4 6
7 1
2 1
```

Sample Output

```
-9 4
7 1
```
